Project Topic: FARMLAND DIVINATION

Abstract:

Nowadays so many land are being uncultivated and also so many farmers are address questions such as "where, why and when" a particular crop is grown.

Farmers can get land which are for lease in different places and of different climatic conditions and soil types.

The farmers can analysis the climatic conditions and soil types so that they get the ideas about which crop grow well in that particular area and it also increase more production.

It also helps to eliminate land or fields from uncultivated and make the land more useful and also helps farmers to double their profit.
 The farmers can choose the land according to their concepts. If the particular type of land is not available at that time, the data is stored so that if later that particular type of land made available, the particular farmer will have informed it as by a notification.
Farmers can also get idea and clear picture about their cultivation process and they can analyze that if the cropping is making profit or loss.
They can also estimate how much profit they can make during a particular period of time.
